Results: Policy comparison

The simulator ran the same 12-task workload under both placement policies. Both completed all tasks; **Latency-First** had lower average latency, while Capacity-Aware spread utilization more evenly.

Placement Policy	Placement (Edge/Fog/Cloud)	Edge Util.	Fog Util.	Cloud Util.	Avg. Latency	Success Rate
Latency-First	3 / 4 / 5 tasks	68.75%	75.00%	56.25%	**80.00 ms**	100% (12/12)
Capacity-Aware	2 / 4 / 6 tasks	56.25%	65.62%	59.38%	91.67 ms	100% (12/12)

Visualization

Figure 1: Average task latency and node resource utilization by policy.

Reproduction

The table and chart are from the repository's experiment results.

To regenerate the charts and result tables, run:

```python
python -m experiments.runner
```
